

Risk Assessment Refined

APiS IQ-RM Integration Accelerator

It is critical that any design and its components be thoroughly tested for functionality and reliability, especially when user safety is at stake. APiS IQ-RM allows engineers to streamline Failure Mode and Effects Analysis (FMEA) and ensure proper system design. Systems entered in APiS IQ-RM will have a thorough visual representation.

As modern products utilize countless electronic systems, reentering designs from one tool to another becomes a tedious, and in some cases, monumental effort. For a system with several thousand components, a full analysis may take weeks or months to manually complete.

The **APiS IQ-RM Integration Accelerator** developed by X by 2 automates this process by defining templates for component failures and their potential failure rates, eliminating hundreds to thousands of hours of data entry.

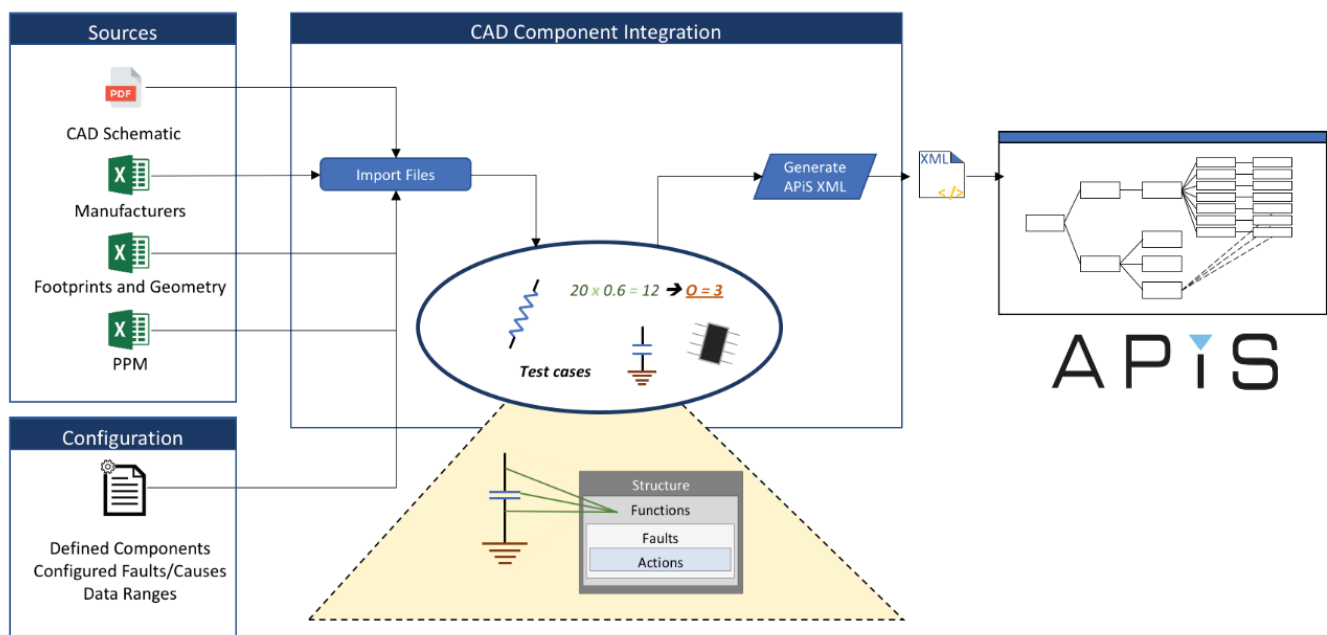

The accelerator can be further adapted for new inputs from many different industries and use cases, integrating critical and complex systems into IQ-RM and accelerating risk management processes.

Benefits

APiS IQ-RM Integration Accelerator

- Streamlines the steps between design and analysis
- Eliminates hundreds to thousands of hours of data entry
- Can be adapted to any industry
- Configurable templates for different use cases
